Google prepares Android for wearables Along with announcing the availability of Android Wear apps earlier today, the search company also pushed out Google Play Services 5.0 to almost all Android devices. There's no need to download it either. The services update comes through the Google Play Store to almost all smartphones and tablets running Android 2.3 Gingerbread to 4.4 KitKat. Google Service 5.0 brings with it an API designed to make it easier for users to communicate with apps running on Android Wear devices. In a developer update Google wrote that the 5.0 update allows apps to sync data, exchange control messages, and transfer data between wearables and compatible phones. Matchmaker, make me a match The Android Wear specific updates will only work with devices. What's more, smartwatches and activity trackers running Google's wearable OS will only work with certain handsets. To help users make sense of whether devices can pair properly, the Mountain View company launched an Android Wear Check website. The online tool allows users to check the compatibility of their smartphone before trying to find a match. Aside from all the Android Wear specific tools, the updates services also adds a dynamic security provider allowing developers to rapidly deliver security patches. A necessity in today's world when it seems like some other app has been breached every week. A tweak to Google Wallet adds the option to save offers or deals to users' wallets. At registers and online carts users can now pay for goods with both their Google Wallet Balance and linked credit or debit cards in case they don't have enough virtual currency in the bank to make the purchase. The virtual wallet will also know when users have walked into a store by tracking their location data to automatically pull up loyalty cards and offers. Google hopes this will save the user the hassle of digging and carrying around the items physically when they can simply scan codes from their phones. On the developer side app makers will be happy to hear Google has improved analytics capabilities for e-commerce sites. The updated tools include new ways to measure marketing and merchandising strategies, and search for the app like a webpage with an updated indexing API. Google preps for Android Wear but what of Android L? I recently I went to install an app on my Verizon-branded Droid Bionic, and I was greeted with a notification (Figure A) that the Android Market was upgrading to Google Play. The new iteration of the Android Market, Google Play (or the Play Store), offers more than just a change in nom de plum. Now, as tragic as that name is (makes it seem like it's nothing more than a toy store and, in my opinion, belittles the power of Android), the new store offers some pretty cool features. Figure A The Android Market upgraded to Google Play or the Play Store. The Play Store still offers all the apps and app goodness you've grown accustomed to, and there's even more under the hood. Google Play is now your one-stop-shop for all things multimedia, including apps, movies, music, books, and more. Apparently, Google has followed in the footsteps of Apple's iCloud. When you purchase a song, movie, book, or app on one Android device, that purchase will also be accessible from play.google.com. Once you log in with your Google account credentials, and you can access all of your multimedia from there. That's not all. From this same page, you can even push applications to other devices associated with your account (Figure B). Figure B From the drop-down, select the device you want to push the app to. When you open up the drop-down, it will be clear which devices are compatible with the app. For instance, I wanted to push Antipaper to another device, but since it's a tablet-only app, I couldn't push it to a smartphone. This pushing process is transparent — the small downloading icon will appear in the notification area and the app will just appear in the application drawer. It really is that simple. Of course, only the things you purchase from the Play Store will appear in your play.google.com account. If you download and install a file from a third party, it won't be available in your cloud. At first, I was a bit apprehensive — the name alone made my brow furrow. However, the addition of the play.google.com cloud makes this upgrade well worth the effort Google has put into the change. And, of course, this was inevitable. Once Apple made the iCloud available, people with other platforms were going to want this same feature. With iCloud, every user gets 5GB free. Above that initial 5GB, there's a monthly associated cost. Will this be the same with the Play Store? Or will Google go the permanent free route in an attempt to woo more users over. As of now, there's no mention of size limitations. I'm sure, at some point, this will come into play. All in all, Google Play is certainly a step forward for the Android platform. This is especially true if you're a fan of purchasing multimedia or if you have multiple devices and would like to better manage those devices from a single point of entry. What are your thoughts about this change? Share your opinion in the discussion thread below. Google is rolling out Google Play services starting today, bringing another of the great developer tools they showcased at Google I/O to the public. For those of us that aren't developers, it's pretty easy to wrap your head around. If your device runs Froyo or higher and has access to the Google Play store, you'll have a new Google component to download. It's a set of libraries and tools that developers can use to authenticate with your Google account. When an app needs to access your private data from a Google application, they can use the new tool to get that access securely without requiring you to enter the (hopefully) long and secure password you use for your Google account. Version one of the service includes Google+ sign-in and +1 APIs as well as new OAuth 2.0 functionality. OAuth 2.0 is a pretty big deal. It scales better than previous versions, is more secure, and as Googler Tim Bray notes "especially, because typing your password into a mobile device sucks". Bray has also posted an excellent overview, complete with code samples, using the new OAuth components at the Android Developers blog. Best of all, this will all be transparent to the end user. Once the required code is installed on your Android phone or tablet, the rest is up to developers. No more typing in your password on a mobile webpage, or getting a one-time password from Google two-step verification, we'll simply be able to choose the account we would like to use and go. We see that now with many of Google's apps, but the new method will bring it all together for a consistent -- and safe -- user experience using open standards. The developer portion of the service is available now, and you can find all the info you need to start using it at the links below. The client side (what we'll need on out phones) should be rolled out completely in the coming weeks, and we'll start seeing apps use the service once Google announces the rollout is complete. Source: +Android Developers; More: Android Developers blog, Google Developers, Tim Bray Google Play is the cornerstone of Google's ecosystem of content and has become a critical part of Android. It reaches almost all of Android and through Play Services is capable of fixing many of Android's problems, especially in regards to updates and security. Google Play also is a content library and ecosystem that is accessible on more platforms than almost any other. Born as the Android Market, it's grown from just a home for apps and is now the one-stop shop for applications, books, movies, music, TV shows — basically anything and everything that you can buy and use on your Android phone or tablet. Downloading and managing apps The first thing you're going to want to do when getting a new Android phone is downloading new apps, or re-installing ones that you previously had on another phone. It's easy to do this, and there are plenty of tools to help you get there. How to download and manage apps from the Google Play Store Sharing and review apps When you've downloaded a new app, you may want to review it or share with your friends. The reviews help the developers with feedback for their changes, and sharing helps spread the word. How to share and review apps in Google Play Downloading and sharing movies, music, and books Google Play isn't just about apps. You can buy and rent movies and TV shows, subscribe to Google Play Music's unlimited streaming service, or buy the latest books from your favorite Library. Top 5 things to know about Google Play Family Libraries How to use a Google Play gift card Did someone give you a gift card to Google Play that you need to spend? Wondering how to get your gift card into Google Play, or what to spend it on? We're here to help! How to use a Google Play gift card New features in 2018 One great feature of the Play Store is the ability for users to try beta versions of their favorite applications. That's going to get even easier soon: users will no longer need to sign up for the beta versions. If developers still want a version of their application to be invitation-only, they can maintain a closed alpha version. Another great feature for both developers and users is Dynamic Delivery: apps are compiled for different screen resolutions, languages, and architectures. Currently, the application downloads all the files needed for all resolutions, languages, and architectures, but apps will soon be able to download only the files needed to make the app run on their specific phone. Finally, we have Slices. Not pizza slices (though we have those too), but App Slices. An example of an App Slice is the playback controls for a video app; users can see this content in places like the search bar. If the user is searching for "The Flash," they'll be able to see a quick link to watch The Flash on Netflix. More: What's new in Google Play at Google I/O 2018?
